

Licensing

Batch™/Batch Plus™

Developer License – Licensed by PC. Used to develop an unlimited number of data collection programs. Also includes the communication utilities used to load programs onto the terminal and retrieve data from the terminal. There is no limit as to the number of terminals that can communicate with a licensed PC.

Runtime License – Licensed by PC. Set of communication utilities used to load programs onto the terminal and retrieve data from the terminal. There is no limit as to the number of terminals that can communicate with a licensed PC.

Terminal – There is **NO** licensing necessary for the terminal.

Example: Customer wants to develop their own programs. They have 3 areas in their warehouse that will need to host data download stations (PC's) using 10 terminals. The customer would need a Developer to write the programs and 3 Runtimes. They would only need 2 Runtimes if they can use the Developer at one of the download stations.

Batch/Batch Plus demo limitation – In demo mode the terminal is limited to collecting and downloading just 5 records. Upon downloading and deleting the 5 records from the terminal, a new set of 5 records can be collected and downloaded. To remove the demo limitation a program must be saved using a licensed Developer and the program must be loaded onto the terminal using a licensed Developer or Runtime.

Products Available:

Batch Developer	- \$995	Batch Plus Developer	- \$1,495
Batch Runtime	- \$495	Batch Plus Runtime	- \$ 695

OMNI™ (RF)

Developer License – Licensed by PC. Used to develop an unlimited number of data collection programs. Used in conjunction with Runtime and Terminal licenses. Includes the communication utilities used to load programs onto the terminal and retrieve data from the terminal via **batch** mode. Does **not** include the OMNI Communications Server for managing RF communication.

Runtime License – Licensed by PC. Set of communication utilities used to load programs onto the terminal and retrieve data from the terminal in batch mode, and RF mode through the OMNI Communications Server running on a host PC. Used in conjunction with Terminal licenses.

Terminal License – Terminals are required to be licensed to communicate real-time with the OMNI Communications Server. Terminal licenses are used in conjunction with a Runtime license to communicate with a host PC. The OMNI Configuration Utility is used to manage the Runtime and Terminal licenses. Each terminal is assigned a client license from a pool of licenses. No actual license or serial number is loaded on the terminal. However, client software is required to be loaded. The terminal's MAC address is recorded in the PC software. Only those MAC addresses listed can communicate with the OMNI Communications Server. Terminal licenses come in packs of 5, 10, 25, 50, 75, 100, 250, and 500. Larger packs are negotiable.

Example: Customer wants to develop their own programs and have 10 terminals communicating wirelessly to a single host. They would need OMNI Complete and a 5-pack of terminal licenses. If the customer wanted the reseller to write and maintain the programs they would only need an OMNI Runtime and an additional 5-pack of terminal licenses.

OMNI demo limitations – In demo mode the OMNI Communications Server can only manage (1) program and only (1) terminal, and the terminal is limited to making 15 accesses to the OMNI Server in RF mode. The OMNI Server can be stopped and restarted to get a new set of 15 accesses. In batch mode terminals are limited to collecting and downloading just 5 records. The data can be downloaded and deleted from the terminal to get a new set of 5 records to collect and download.

Products Available:

OMNI Complete – includes (1) Developer license, (1) Runtime license and (1) 5-pack of terminal licenses - \$2,995
OMNI Runtime – includes (1) Runtime license and (1) 5-pack of terminal licenses - \$1,495
OMNI Terminal License – packs of various quantities – from \$75 to \$40 per terminal
