

V3.0 Information Bulletin-Developer

One of the more striking changes for 3.0 is the combination of the Batch Plus Developer and OMNI Developer have been combined into one product called the 'ITScriptNet Developer'. The part number is ITSNDVELOPER and has a suggested list price of \$1,500.

Here's what it means to you:

- If you currently have an OMNI Developer serial number OR a Batch Plus Developer serial number, when you upgrade to the V3.0 Developer version your serial numbers will continue to work just fine. **You do NOT need to buy anything or get a new serial number. This is a FREE upgrade.**
- Before downloading and installing the V3.0 Developer to your PC and the Client to your device(s), please review the [Upgrade Guide](#) as this upgrade is not a simple overwrite as previous upgrades have been.
- In the Program Settings screen of the Developer, the programmer will set the communication method that the program will use. When Batch Plus is selected, the OMNI functions and features will be hidden or disabled. If a program includes OMNI functionality but the device or PC has a Batch Plus license, the OMNI features won't work. The rest of the program will.
- The V3.0 download will include one client for each device supported. We no longer have separate clients for Batch Plus and OMNI. It is, in essence, the OMNI client. The communication license, whether it is the PC-based Runtime license or the device license, will dictate the communication method the client will support. A Batch Plus license will allow the device to communicate to a PC via its cradle or communication cable. The OMNI license will also allow these batch methods in addition to 802.11, GPRS, modem and a network/internet connection over ActiveSync (Vista calls it 'Windows Mobile Device Center').
