

# ITScript Net®

## Run Order of Scripts

**Before Prompting** – Runs before the prompt is loaded

**After Display** – Runs after all elements are displayed to the user

**After Prompting** – Runs after data is entered to all elements and the prompt is *ready* to move to the next prompt (*before* it actually moves).

On individual elements, the Validation Tab validations will run *after* the After Prompting and *before* the Prompt-Level-After Validation

**After Validation** – Runs after range checking, min/max, mask, element validations  
Runs the next prompt script (which, if the next prompt is SAVE, will save ALL data, even any duplicates).

**MESSAGE vs Validation Fail** – The Message function can be used within the program where the script continues on. But if a message is needed in the AfterValidation on the Prompt, you have to use Validation Fail to stop the script from continuing.

**Fn Buttons** - Script in the Fn buttons will override the action setting of that element's specific properties. In the example below, the After Scanning and After Enter Pressed also require a control, as shown in the text in the gray area below the script window.
